Running the KPI Platform

A guide for Tolulope Adekoya — Administrator and HR Officer
Calm Global Information Technology Ltd · kpi.calmglobal.com · 26 October 2026

You hold two things at once, and they are deliberately separate.

	What it is	What it lets you do
Administrator	A permission, held by three people	Manage staff, departments, KPIs, settings. Raise appraisals. See everything.
HR Officer	A posting, held by you alone	Write the HR comment on an appraisal. Nobody else can, not even another administrator.

Being made an administrator does not make someone HR, and putting someone in the Human Resources department grants them no permissions. The three ideas — permission, posting, department — never imply one another.

1. Signing in

Go to **kpi.calmglobal.com** and sign in with your work email. The sidebar shows **Calm Global** and the browser tab carries the full company name.

> **Change the default password**
>
> Every account is created with the password **Welcome@123** and nothing forces a change. Until each person changes theirs in Settings, anyone who knows the pattern can sign in as a colleague and read their appraisal. Chase this first.

2. Your dashboard — the Admin Console

Four tiles across the top, then whatever needs attention.

Tile	What it means
Awaiting HR	Appraisals that have cleared the unit head and are waiting on **your** HR comment. Another administrator sees this tile too, but it reads "with Tolulope Adekoya" for them.
Staff	Headcount, with how many are administrators and unit heads.
Appraisal Completion	How many appraisals are finished out of those raised.
KPIs Tracked	How many KPIs exist, and how many have no value recorded.

Below the tiles: the queue of appraisals waiting on you, a **Setup Gaps** panel listing staff with no appraisal or no department, the appraisal pipeline by stage, and integration health for the Azure DevOps sync.

3. Managing staff

Everything about a person is on the **Staff** page. Click any badge in a row to change that one thing; the dropdown saves as soon as you pick.

To do this	Where
Add someone	**+ Add Staff** — name, email, department, level, employment, role. An account is created automatically.
Change role, department, level or employment	Click that badge in their row
Fix a name, login email or Azure DevOps email	Pencil icon
Reset a password	Key icon — gives you a temporary password shown once, and emails it to them
Hand over the HR officer job	Tick icon on the person taking it over
Remove someone	Bin icon — they lose access, their past appraisals are kept
Create or delete a department	**Departments** button

Levels and employment. Each person has a grade level (1 upward) and is marked permanent or contract. Changing a level is recorded with the date and who did it, and the trail shows under their name. Filter the list by department or by contract status.

Departments are job functions — Tech, Sales, HR, Support, Executive. The department decides which unit head reviews a person and which questions their appraisal asks. Put the MD and Chairman in Executive and never give that department a unit head, or they will start receiving review requests for the board.

4. Running a review cycle

Appraisals → **Start a cycle.** Pick the period, pick a department or everyone, and the system raises one appraisal per person. Each takes the question set of that person's own department.

Anyone who already has an appraisal covering exactly those dates is skipped and named, so running the same cycle twice does nothing the second time. If you add a new starter mid-cycle, simply run it again.

Everyone in the cycle is emailed that their self-assessment is waiting.

The five stages

Stage	Who acts	Weight	Who is emailed
Created	You or a unit head	—	The employee
Self-assessment	The employee rates 14 attributes out of 10	30%	Employee, unit head, admins
Unit head review	Their department's lead scores 12 attributes out of 8	50%	Employee, admins
HR comment	**You, and only you**	no score	Employee, the MD
Final score	Alemede Sunday (MD) scores out of 100	20%	Employee, with grade

An appraisal cannot skip a stage, and nobody can save a review with attributes left unscored — a missing attribute would silently count as zero and drag the grade down.

Grades

Grade	Score	Meaning
A	96 – 100	Outstanding performance
B	81 – 95	Exceeds expectations
C	65 – 80	Meets expectations
D	below 65	Below expectations

5. Your job: the HR comment

When a unit head finishes, the appraisal lands with you and goes no further until you act. Open it from the Admin Console queue or from Appraisals.

1. Open the appraisal and go to the **Unit Head Review** tab.
2. Read the employee's self-assessment and the unit head's scoring and comment.
3. Write your comment in **HR / Admin Comment** — attendance, conduct, anything on file.
4. **Save HR Comment.** The appraisal moves on and the MD is emailed.

Your comment carries no score. It does not change the grade; it is the people record attached to the appraisal.

> **Only you can write it**
>
> Other administrators see this section and can read it, but the box is disabled for them and names you. If you go on leave, hand the posting over on the Staff page first, or no appraisal can get past this stage.

6. Sending an appraisal back

If something is wrong, hand it back a stage instead of deleting it. Nothing already written is lost.

If it is sitting at	Who can send it back	It returns to
Submitted	The unit head, or an administrator	The employee, to redo their self-assessment
Unit head reviewed	**You, as HR officer**	The unit head, to redo their scoring
HR reviewed	The MD	You, to redo the HR comment

A reason is required and the person receiving it sees it, both in the app and by email. The note clears once they resubmit. A completed appraisal cannot be sent back.

7. KPIs and the Azure DevOps sync

KPIs are organisation-wide measures with a target and a current value. Create and update them on the KPIs page; they drive the dashboards and can be exported to Excel.

Azure DevOps. Settings → Integrations connects the board and pulls each person's work items — total, completed, active, story points. Counts only cover the period you sync, so sync the exact review period, not a rolling window. The quickest way is the **Sync tasks for this period** button on the appraisal itself, which uses that appraisal's dates.

A person's items are matched on their login email, or on the separate Azure DevOps email if theirs differs — set that with the pencil icon on the Staff page.

8. What you cannot do, and why

	Why
Write the MD's final score	That section belongs to Alemede Sunday. An administrator can only stand in where an organisation has nobody holding the MD role at all, which is not the case here.
Score a unit head review	A unit head reviews their own department. You can do it as an administrator, but the department's own lead is the right person.
Create a second organisation	Existing members are blocked from onboarding again. This is why a near-duplicate company was created before, and it cannot happen now.

9. Who sees what

Role	Dashboard	Staff	Appraisals
Employee	Their own appraisals, grade and score history	No access	Their own only
Unit Head	Their team and who is awaiting review	View	Their department
Administrator	Admin Console	Full control	All
MD	Executive overview	View	All, writes the final score
Chairman	Executive overview	View	All, read-only, changes nothing

Employees see their own result — grade, score, the three weighted components and every comment — once the appraisal is completed, and nothing of the reviewers' work before that.

10. Worth doing first

1. Ask everyone to sign in and change their password off **Welcome@123**.
2. Check each person's department is right — it decides who reviews them.
3. Put the MD and Chairman in **Executive**, and give that department no unit head.
4. Set levels and mark contract staff, so the records are complete before the first cycle.
5. Run one appraisal end to end with a willing colleague before opening a cycle for everyone.

If anything behaves oddly, the **Audit Log** records every change — who did what and when — and is the fastest way to see what actually happened.
